# MODULAR LED BAR

Farrows has developed a unique modular LED bar system.

A wide variety of set-ups and configurations are possible using basic modules, foldable and cooling modules, modular rear cabinets and accessories.

The use of Pyra-led polycarbonate, specially developed for LED lighting, combined with seamless module connections ensures even colour distribution for maximum effect.

The sleek design and close attention to detail make Farrows' LED bar system a remarkable structure that will work on its own or as an eye-catching feature at your exhibition or event.

## Mobile Refrigeration

Farrows' LED bar modules are designed to accommodate standard hospitality industry equipment, therefore allowing different brands of mobile coolers and tap units to be used. Farrows has also developed its own range of luxury mobile coolers and tap units, which integrate with the LED bar units to create a perfect system.

## Modules

The LED bar system is formed by 3 different basic modules and a rear casing module. These modules comprise foldable, aluminum frames, equipped with 1cm thick Pyra-led polycarbonate. Inlay plates, polycarbonate sides and sliding doors complement this set-up to create a very luxurious complete system.

## Compact for Transport

The LED bar modules developed by Farrows are foldable and therefore take up minimal space during transportation. For quick and easy set-up, the modules connect using a combination of cam locks and high power magnets. Therefore even the largest and most complex configurations can be constructed in a short amount of time.

All LED bar modules and accessories are transported in upholstered dollies to keep the risk of damage to a minimum, ensuring the system always looks as good as new.

Throughout Benelux, your desired configuration can be installed and removed for a reasonable fee by a team of Farrows specialists.

## LED Lighting

Farrows uses 50cm and 100cm high power IP67 LED fixtures.

The specially developed bar incorporates frosted lens caps, preventing staining and ensuring maximum diffusion and efficiency of the light. The use of DMX (RGB) technology means numerous color variations and transitions can be realised.

## Options

By making use of two different straight modules, a 45 degree module and a modular rear casing, a wide variety of configurations are possible. Check out our website for various 3D configurations of the LED bar to meet your event, presentation or exhibition requirements.
